The following is a summary of the meeting we had on March 19, 2019 documenting our approach going forward on PFAS:

- DEC’s August 18, 2018 Technical Memorandum has been updated (copy attached). It reflects our intent going forward to use the EPA Lifetime Health Advisory (LHA) level of 70 ppt for the sum of 2 PFAS. The previous DEC Technical Memorandum action level used a 70 ppt sum of 5 PFAS.

- State and private responsible parties will continue to provide alternative drinking water where the contaminated site/plume had drinking water tested for PFAS prior to 3/19/19 and the results were above the previous DEC action level of 70 ppt for the sum of 5 PFAS. If there are additional drinking water sources tested in these same sites/plumes after 3/19/19, residents will be provided alternative drinking water if the PFAS results are above the previous DEC action level.

- Risk assessment of remaining sites where the state may be a responsible party, but are not yet sampled, will continue.

- If PFAS testing in drinking water is initiated at additional sites, regardless of the responsible party, the responsible parties will be required to provide alternative drinking water if the results exceed the EPA LHA level of 70 ppt for the sum of 2 PFAS.

- No margin of error will be used for the 70 ppt EPA LHA level (previously there was a 5 ppt margin of error for provision of alternative water).

- If determined to be within ADF&G authority, catch and release signs will be posted or fishing will be banned at Kimberly Lake (and other lakes where PFAS may be found in surface water or fish). Signs saying not to eat the fish will be removed.

- Lakes with water testing positive for PFAS will no longer be stocked with fish by ADF&G.
